NAD+ ADP-ribosyltransferase (EC 2.4.2.30) - African clawed frog (fragment)
N;Alternate names: poly ADP-ribose polymerase
C;Species: Xenopus laevis (African clawed frog)
C;Date: 22-Nov-1993 #sequence_revision 10-Nov-1995 #text_change 20-Jun-2000
C;Accession: S31735; PNG495

Sequence 2, Application US/08860886

Patent No. 633509

GENERAL INFORMATION:

APPLICANT: Burkle, Alexander

APPLICANT: Burkle, Alexander

APPLICANT: Jan Heiner, Kupper

TITLE OF INVENTION: VECTORS AND VIRUSES FOR USE

TITLE OF INVENTION: IN GENE THERAPY

NUMBER OF SEQUENCES: 2

CORRESPONDENCE ADDRESS:

ADDRESSEE: Pennie & Edmonds, LLP

STREET: 1155 Avenue of the Americas

CITY: New York

CITY: New York

STATE: NS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 16, 1

Patent No. 6132968

GENERAL INFORMATION:
APPLICANT: Le, Xiao-Chun
APPLICANT: Wenfeld, Michael
APPLICANT: Xing, James Z.
TITLE OF INVENTION: Methods for Quantitating Low Level
TITLE OF INVENTION: Modifications of Nucleotide Sequences
NUMBER OF SEQUENCES: 3
CORRESPONDENCE ADDRESS:
                        Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 613;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 1, Application US/08405615
Patent No. 5602095
GENERAL INFORMATION:
APPLICANT: Pastan, Ira
APPLICANT: FitzGerald, David J.
TITLE OF INVENTION: Recombinant Pseudomonas Exotoxin with
TITLE OF INVENTION: Increased Activity
NUMBER OF SEQUENCES: 16
CORRESPONDENCE ADDRESS:
ADDRESSEE: Ellen L. Weber
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           E: Ellen L. Human brain poly-ADP-ribose-polymerase protein.

(first entry)

```
This invention describes novel human and murine poly(ADP-ribose)
polymerase (PARP) homologues, which are characterised by an amino acid
sequence with a functional NAD'+-binding site and no zinc finger
sequence motif, of general formula CX_2CX_ZMHX_2C (I). The nucleic acid
sequences, PARP homologues and antibodies are useful for analytic
detection of PARP homologues and for identifying PARP effectors or
binding partners, as well as for determining their effectiveness.
DARP-binding partners are useful for the diagnosis or therapy of a
disease condition, which is the result of a PARP protein, especially an
energy deficiency, which may comprise tissue damage from cell death
following necrosis or apoptosis. The disease condition may be chosen
from a neurodegenerative illness, or sepsis or ischemic tissue damage,
in particular neurotoxic disturbances, etc. This sequence represents the
human PARP2 protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   IQLLEDDAQRNFSVWMRWGRVGKMGQHSLVACSGNLNKAKEIFQKKFLDKTKNNWEDREK 180

This invention describes novel 4-substituted 2H-phthalazin-1-one derivatives (I) which are used for the treatment or prophylaxis of diseases associated with elevated poly-(ADP-Tibose)-polymerase (PARP; CC diseases associated with elevated poly-(ADP-Tibose)-polymerase (PARP; CEC 2.4.2.30) activity. The products of the invention have nootropic, cardiant, vasotropic, antioflammatory, antiparkinsonian, nephrotropic, cardiant, vasotropic, antioflammatory, antitheumatic, antibacterial, cardiant, trauma or massive bleeding, especially apoplexy or antidiabetic. (I) are especially used for treating or preventing cantidiabetic. (I) are especially used for treating or preventing or preventing ischemial trauma; or Alzheimer's disease, Huntington's disease or spinal-cranial trauma; or Alzheimer's disease, Huntington's disease or spinal-cranial trauma; or hardeimer's disease, Huntington's disease or spinal-cranial trauma; or hardeimer's disease, Huntington's disease or spinal-cranial trauma; or preventing ischemic damage effort or parkinson's disease, or partial aschemic aschemic damage effort cardiac ischemia, treating conference or theory partial attacks) or partial appleptic attacks (e.g. petit mal and complex partial attacks), treating microinfarction (e.g. during and eart cand complex partial attacks), treating microinfarctions (e.g. during and carteries (e.g. after PCTA or by-pass operations) or peripheral arteries or after porta or peripheral arteries or after porta or dispersion of critically gonstricted coronary carteries (e.g. after porta or by-pass operations) or peripheral arteries or after proper and septic shock, inflammatory and rheumatic chibitic pare (e.g. rheumatoid arthritis), and diabetes mellitus. Although (c. inhibit pare proper proper proper proper pareity (e.g. with K_I values of 1-20 mM) and high selectivity for PARP2 relative to correct of more than 5).
                                                                                       Human; poly ADP-ribose polymerase; PARP; neuroprotective; nootropic; cerebroprotective; antiparkinsonian; nephrotropic; cardiant; vasotropic; anticonvulsant; cytostatic; antibacterial; immucouppressive; treatment; antinflammatory; antirheumatic; antiaflammatory; antirheumatic; antiaflabetic; epilepsy; 2H-phthalazin-lone derivative; neurodegenerative disease; tumor; neuronal damage; Alzheimer's disease; Huntington's disease; metastasis; parkinson's disease; ischemic damage; microinfarction; sepsis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Drugs for inhibiting PARP or especially homologous enzymes comprising 4-substituted phthalazinone derivatives, useful e.g. for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           *-substituted phthalazinone derivatives, useful e.g. for treatineurodegenerative disease, ischemic damage, tumors or diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ó

```
This sequence represents human poly(ADP-ribose) polymerase (hPARP2).

This protein causes the covalent addition of polymers of ADP-ribose concerning protein causes the covalent addition of polymers of ADP-ribose to protein targets. PPARP2 activity is induced in many instances of oxidative stress or during inflammation where there is direct damage control of the DMA. PPARP2 may be used-to identify antagonists which can be used to treat a human having a disorder mediated by PARP2 cativity, such as, inflammatory, neurological, cardiovascular, cor neoplastic tissue growth disorders, e.g. ischemic stroke, hemorrhagic shock, myocardial ischemia or infarction, cerebral vasospasm: rheumatorid, osteo- or gouty carthrids, spondylitis; Behcef's disease; sepsis, septic or endotoxic shock, gram negative or positive sepsis, toxic shock syndrome; multiple or gran injury syndrome secondary to septicemia, trauma, or hemorrhage; allergic or vernal conjunctivitis, uveitis, thyroid-associated ophthalmopathy; eosinophilic granuloma; asthma, chronic bronchitis, ophthalmopathy; eosinophilic granuloma; asthma, chronic bronchitis, and prain or extremities; wester fibrosis; keloid formation, scar tissue formation, staticatic pulmonary disease, silicosis, pulmonary sarcoidosis, pleurisy, alveolitis, reperfusion formation, scar tissue formation; atherosclerosis; systemic lupus crythematosus, autoimmune thyroiditis, multiple sclerosis; Reynaud's sydnemic or syndrome; graft versus host disease, cromic or glomerulonephritis; inflammatory bowel disease, cromic or sudopic demantisis, portasis, unitionia, fever and myalgias context or adapted bemantist, portasis, autoinma; syndrome; diseases involving clauser or injury due to minor trauma; Sjogren's syndrome; diseases involving clauser or any applace and myalgias or environs any thock and profice demantist, beases, bronch diseases involving and presses any process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antigen-antibody complex mediated diseases; hypovolemic shock; Type 1 diabetes mellitus; acute and delayed hypersensitivity; disease states due to leukocyte dyscrasia and metastasis; thermal injury; granulocyte transfusion associated syndromes; and cytokine-induced toxicity. hPRRP2 and antibodies to it, can also be used to diagnose these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 RTEDKQD------ESVKALLLKGKAPVDPECTAKVGKAHVYCEGNDVYDVMLN 107

New human polypeptide of the polyADPribose synthetase family for use in diagnostic assays and for screening modulators used for preventing and treating inflammation, autoimmune disease and Alzheimers disease

Claim 1; Page 21; 30pp; English

```
This sequence represents a novel human poly(ADP-ribose)
synthetase, sbhPARS2. The invention also relates to fragments,
corrients and sequences with at least 95% identity to the sbhPARS2 proteins protein or nucleotide sequence; expression systems and host cells
comprising an sbhPARS2 nucleic acid sequence; the recombinant expression corresponse in a mammal. The sbhPARS2 protein is useful for inducing an immunological response in a mammal. The sbhPARS2 protein is useful for identifying compounds which inhibit or stimulate its activity or expression level.
Such agonists and antagonists of sbhPARS2 are useful for treating human disease including ischaemia and ischaemic tissue injury (e.g., cerebral and cardiac ischaemia, myocardial infarction, stroke), inflammation, autoimmune disease (e.g. diabetes, multiple sclerosis) and Alzheimer's contommoune disease (e.g. diabetes, multiple sclerosis) and Alzheimer's disease). sbhPARS2 nucleic acids are useful as diagnostic reagents for detecting mutations in the associated gene; as hybridisation probes to isolate full-length sbhPARS2 condense and shbPARS2 genomic clones; and for chromosome localisation studies. The sbhPARS2 genomic clones; and for chromosome localisation studies. The sbhPARS2 genomic clones; as an immunogen to produce antibodies for therapeutic use. sbhPARS2 proteins, nucleotides and antibodies are also useful in screening methods for the production of mRNA and contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               349

                                                                              The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, encropolacial (e.g. parkinsonism, maninguitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g. arthritis) and diabetes. The present sequence is a PARP protein, and including which was used to design the antisense

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP PARP (Poly (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 216

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oilgo-dT primer and an oilgounclectide complementary to the complementary strand of a polynuclectide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oilgonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oilgonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oilgonucleotide comprises as 3'-end sequence complementary to a polynucleotide which comprises as 3'-end sequence, where the oilgonucleotide comprises as 1'-end sequence is selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the companial of the proteins encoded by

1;
the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH1342 sepresent human cDNA sequences; AAB92446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; PARP; Poly (ADP-ribose) polymerase; antisense oligonucleotide; cytostatic; nootropic; neuroprotective; antiinflammatory; antidiabetic; immunosuppressant; hyperproliferative disorder; cancer; cellular injury; oxidative stress; neurological disorder; parkinsonism; apoptosis; meningitis-associated intracranial complication; ischaemia; inflammatory disorder; autoimmune disorder; arthritis; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          480

The invention relates to antisense oligonuclectides targeted to human PARP nucleic acid and inhibiting expression of human PARP PARP (POLY (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonuclectide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein, the cdNA encoding which was used to design the antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              100 DVYDVMLNQTNLQFNNNKYYLIQLLEDDAQRNFSVWMRWGRVGKMGQHSLVACSGNLNKA 159

This protein contains amino acids 1-662 of hPARPI fused upstream of amino acids 230-583 of hPARP2. The CDNA encoding this sequence was amplified using the primer sequences given in AAC85311-40 and AAC85342-51. The fusion protein coding sequence was cloned in a baculovirus expression vector for the expression of the fusion protein. The protein of the invention, hPARP2, causes the covalent addition of polymers of ADP-ribose to protein targets. hPARP2 activity is induced in many instances of oxidative stress or during inflammation where there is direct damage to the DNA. hPARP2 may be used to identify antagonists which may be used to treat a human having a disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New human poly(ADP-ribose) polymerase for treating inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders, such as, arthritis, encephalitis, myocardial ischemia, and leukocyte metastasis

ji Ji

The present invention relates to the isolation of novel human neoplastic disease associated polypeptides, and CDNA (AAS34767-AAS35050) and DNA sequences encoding for these polypeptides. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of disorders involving neoplastic disease such as concer, brain stem glioma, adult liver cancer, childhood cerebellar cancer, brain stem glioma, adult liver cancer, childhood cerebellar astrocytoma, or Hodgkin's lymphoma). The sequences of the invention may astrocytoma, or Hodgkin's lymphoma). The sequences of the invention may astrocytoma, the polypurcledrist disorders, reproductive disorders, muncue system disorders, pulmonary disorders, reproductive disorders, and renal disorders. The polypurcleotide sequences of the invention are also useful in gene therapy. AAU21560-AAU31851 represent the novel human complastic disease associated polypeptides of the invention.

Complastic disease associated polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO cat fitp.wipo.int/pub/published_pct_sequences. ö Novel polypeptides and polynucleotides useful as diagnostic reagents to diagnose diseases or disorders associated with aberrant expression or activity of polypeptides, and for treating cancers, rheumatoid arthritis Gaps 192 QMDYATNTQDEEETKKEESLKSPLKPESQLDLRVQELIKLICNVQAMEEMMMEMKYNTKK 251 252 APLGKLTVAQIKAGYQSLKKIEDCIRAGQHGRALMEACNEFYTRIPHDFGLRTPPLIRTQ 311 431 491 492 AEGLLQGKHSTKGLGKMAPSSAHFVTLNGSTVPLGPASDTGILNPDGYTLNYNEYIVYNP 551 9 Human; poly(ADP-ribose) polymerase; hPARP2; oxidative stress; ARDS; 312 KELSEKIQLLEALGDIEIAIKLVKTELQSPEHPLDQHYRNLHCALRPLDHESYEFKVISQ YLQSTHAPTHSDYTMTLLDLFEVEKDGEKEAFREDLHNRMLLWHGSRMSNWVGILSHGLR IAPPEAPITGYMFGKGIYFADMSSKSANYCFASRLKNTGLLLLSEVALGQCNELLEANPK Length 379; Indels Ouery Match 65.6%; Score 1966; DB 22; Best Local Similarity 98.9%; Pred. 2001-025335/03. N-PSDB; AAC85314. New human poly(ADP-ribose) polymerase for treating inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders, such as, arthritis, encephalitis, myocardial ischemia, and leukocyte metastasis

Example 2; Page 100-01; 129pp; English.

This sequence is encoded by the 5' fragment of the human parp2 (poly(ADP-ribose) polymerase) cDNA. The cDNA sequence was amplified cusing the primers given in AAC85307-13. DNA derived from spleen and testis cDNA libraries were used as templates. The primers given in AAC85315-17 were used to confirm the sequence of the 5'-hPARP2 fragment. The amplified fragments. P2-1 and P2-9 (AAC85318-19) were cloned to help determine that hPARP2 has no open reading frame of cloned to help determine that hPARP2 has no open reading frame of 1080 nucleotides. The protein of the invention, hPARP2, causes the covalent addition of polymers of ADP-ribose to protein targets. The PARP2 activity is induced in many instances of oxidative stress or during inflammation where there is direct damage to the DNA. PARP2 may be used to identify antagonists which may be used to treat a human having a disorder mediated by PARP2 activity, such as, inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders. hPARP2 and antibodies to it, can also be used to to diagnose these conditions.

The CDNA sequence was amplified using the primers given in AAGB315-17. DNA derived from a testis cDNA library was used as a template. The protein of the invention, PPARP2, causes the covalent addition of polymers of ADP-ribose to protein targets. hPARP2 activity is induced in many instances of oxidative stress or during inflammation where there is direct admage to the DNA. hPARP2 may be used to identify antaqonists which may be used to treat a human having a disorder mediated by PARP2 activity, such as, inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders. hPARP2 and antibodies to it, can also be used to diagnose these conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    344 PLDQHYRNLHCALRPLDHESYEFKVISQYLQSTHAPTHSDYTWTLLDLFEVEKDGEKEAF 403

Sequences AAU20116-AAU20147 represent the DNA repair and processing polypeptides and their and processing polypeptides and their associated polynucleotides are useful in the diagnosis, treatment can prevention of various types of disorders in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. A pathological condition can be determined by detecting the presence or absence of a mutation in a DNA repair and processing polynucleotide. The treatable disorders include autoimmune diseases such as rheumatoid arthritis, hyperproliferative disorders such as neoplasms of the breast or liver, cardiovascular disorders such as cardiac arrest, cerebrovascular disorders such as cardiac arrest, cerebrovascular clasorders infections caused by bacteria, viruses and fungi, coular disorders such as corneal infection, endocrine disorders such as corneal infection, endocrine disorders such as corneal infection, and disorders such as corneal infection, as glomentulonephritis and respiratory disorders such as asthma and pleurisy. The polypeptides can also be used to aid wound healing, to prevent skin aging due to subburn,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Novel polypeptides and polynucleotides useful as diagnostic reagents to diagnose diseases or disorders associated with aberrant expression or activity of polypeptides, and for treating cancers, rheumatoid arthritis

Claim 11; SEQ ID No 537; 687pp; English.

The present invention relates to the isolation of novel human neoplastic disease associated polypeptides, and cDNA (AAS34767-AAS35050) and DNA sequences encoding for these polypeptides. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of disorders involving neoplastic disease such as hyperproliferative disorders (e.g. leukaemia, bone cancer, bladder cancer, brain stem gliama, adult liver cancer, childhood cerebellar astrocytoma, or Hodgkin's lymphoma). The sequences of the invention may also be useful for treating other disorders such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, gastrointestinal disorders, pulmonary disorders, cardiovascular disorders and renal disorders. The polynucleotide sequences of the invention are also useful in gene therapy. AAU21861 represent the novel human compassite disease associated polypeptides of the invention.

Compassite disease associated polypeptides of the invention.

Compassite disease associated polypeptides of the invention.

Compassite disease associated polypeptides of the invention.

Compassite disease associated polypeptides of the invention are also perification, but was obtained in electronic format directly from WIPO compassite disease associated by the program part of the printed compassite disease cancer and the program part of the printed cancer the value of the invention and the value of the value o
